AMENDMENTS TO THE CLAIMS

The following listing of claims will replace all prior versions and listings of claims in the application.

LISTING OF CLAIMS

(Currently Amended) A compressor comprising:

a diffuser;

a volute defining an open space in fluid communication with said diffuser;

and

an impeller operable to compress a fluid stream and direct said fluid stream to said volute, said impeller including:

a hub having an axis of rotation; and

a plurality of blades extending from said hub, said blades having a surface defined by an axial direction (Z), a radius (R) defined from said axis of rotation of said hub, and a polar angle (Θ) , whereby the polar angle (Θ) is a function of only the radius (R);

wherein said impeller is a radial impeller including an inducer formed proximate a leading edge of each blade, said inducer disposed in a plane that extends generally in said axial direction (Z) of each blade and including a height component in said axial direction (Z) that is substantially five to seven percent of an outer diameter of said impeller.

- (Previously Presented) The compressor of claim 1, wherein each of said blades includes said leading edge and a trailing edge, said leading edge formed proximate said hub and said trailing edge formed proximate said volute.
- (Previously Presented) The compressor of claim 1, wherein said height component of said inducer in said axial direction (Z) is equal to a height of said blade in said axial direction (Z) at said leading edge.
- 4. (Original) The compressor of claim 1, wherein said diffuser is vaneless, said vaneless diffuser including a generally open space in fluid communication with said open space of said volute.

5-10. (Cancelled)

11. (Currently Amended) An impeller comprising:

a hub having an axis of rotation; and

a plurality of blades extending from said hub, said blades having a surface defined by an axial direction (Z), a radius (R) defined from said axis of rotation of said hub, and a polar angle (Θ), whereby the polar angle (Θ) is a function of only the radius (R):

wherein said impeller is a radial impeller including an inducer formed proximate a leading edge of each blade, said inducer <u>disposed in a plane that extends</u> generally in said axial direction (Z) of each blade and including a height component in said axial direction (Z) that is substantially five to seven percent of an outer diameter of said impeller.

- (Previously Presented) The impeller of claim 11, wherein each of said blades includes said leading edge and a trailing edge.
- 13. (Previously Presented) The impeller of claim 12, wherein said height component of said inducer in said axial direction (Z) is equal to a height of said blade in said axial direction (Z) at said leading edge.
 - 14-21. (Cancelled)
